Not illustrated. 1864 Excerpt: ...is still in perfect preservation, having resisted the ravages of time more perfectly than the bricks which it was used to cement. It is found that a puzzuolana which is easily attacked by sulphuric acid is more effective than one which resists the action of the acid. The comparative value of a puzzuolana may also be roughly and rapidly estimated by taking a given measure of lime-water, and agitating it with successive small quantities of finely powdered puzzuolana until the alkaline reaction disappears; the puzzuolana combines with the lime, and abstracts it from the water. The smaller the quantity of the powder required, the more active are its hydraulic powers. Puzzuolana consists chiefly of silicates of aluminum, calcium, and sodium. Many other substances, when added to lime, confer upon it hydraulic properties to a greater or less extent. Gelatinous silica shows it slightly, and a mixture of hydrate of silica with freshly precipitated alumina or magnesia shows it in a remarkable degree. Sand, oxide of iron, and oxide of manganese, are destitute of this property. From a knowledge of these facts it is easy to convert ordinary lime into one possessed of hydraulic properties. Clay is a silicate of alumina; when it is heated with lime, decomposition occurs, the alumina is set free, and silicate of lime is formed. The materials are in this way reduced to a condition suitable for use as a hydraulic cement; but great care is required in regulating the temperature. If it be allowed to rise too high, partial vitrification occurs, which impairs the tendency of the cement to combine with water; while, on the other hand, if the heat be insufficient, the alumina is not liberated from its combination with the silica. The immediate cause of the solidification of these ...
